

**Re: How to record cemetery location info
And be able to search for it in your database.**

Legacy User Group Archived message
(used with authorization from Millennium Corp.)

(The question originally presented was how to enter, and where, to enter a cemetery name and location. Then later be able to create a listing of all people buried at the location/cemetery.)

M. wrote:

Ok, how about if Legacy were to add a field dedicated for the name of the cemetery? Then it would be easy to search for persons buried in the same cemetery. I think it would be helpful to have something like that. When your file starts getting large, you can't remember who all is buried where.

But we can put that in an event and accomplish that. I have done that.

I created an event making the name "Cemetery." If I want to look for my ancestors who were buried at sea, I do this:

1. I add my ancestor
2. I add the event for Cemetery
3. Enter "At sea" for the description

Then if I want to find those buried at sea later, I do this:

1. Go to Search drop down (Ctrl-F)
2. Enter the following: Look for whom? == Individual Where to look == Event Description How to look == Contains What to look for == At sea (Or whatever I am looking for)

Then I get a list of those buried at sea. Will this do what you want?

Note: If you use "Equal To" instead of contains, it will strictly search for that value.
